

Elektor in the 1970s and Beyond

Karel Walraven

By Luc Lemmens (Elektor)

If you want to know about '70s-era electronics (and more), ask Karel Walraven, who began his adventure at *Elektor* in January 1975 as a designer, editor, and translator. He later led the Elektor lab/editorial team during times of exciting technological innovation, and he wrote interesting articles well into the mid-2000s.

Karel Walraven has experienced more than half of *Elektuur's* life years as designer, chief laboratory officer, and (chief) editor of our magazine. Before he started working for the then-called Uitgeversmaatschappij Elektuur — at the time still under the management of its founder Bob van der Horst — he had been a subscriber for many years. He owed much of his electronics knowledge to self-study,

including building projects from our magazine. A 60th anniversary would not be complete without his reflections about the years he worked with us.

Lemmens: How did you start working for Elektor, and what positions did you hold?

Walraven: When I finished my Polytechnic electronics studies, there weren't too many jobs I was interested in. I had been a subscriber to *Elektuur* (as *Elektor* was called in the Netherlands) since I was 15 or so, but the idea of applying for a job there had never occurred to me, until at the job centre they casually mentioned that *Elektor* could *always* use people. So, I applied for a job, and to my surprise, they gave me a lot of homework. I was asked to translate and edit it, and above all to write down how long it had taken me to do so. And so began my adventure at *Elektor* on 1 January 1975 as a designer, editor and translator. I was thrown in at the deep end with the first project I had to set up myself: an oscilloscope was to be made. An experienced German author was supposed to take care of the design, but we sent him away after a week because his schematic turned

The Elektor Scope

out to be stolen and incomplete. It turned out to be a nice project after all, one of the first in which the housing was part of the design from the start.

A few years later, I became head of the lab, a position I held until my early retirement in 2006. For several years, I was also the general coordinating editor responsible for both the lab and the editorial staff.

Lemmens: Each edition of *Elektuur* required new projects. Where did the ideas come from?

Walraven: First of all, as a designer or editor, you have to be curious by nature. You read the publications of manufacturers and the magazines of your competitors. Then, of course, you have contact with your colleagues and, last but not least, with the readers. They come up with a lot of ideas, sometimes in the form of just a suggestion, often as a ready-made project. You absorb all that information, and for me, usually as soon as I wake up in the morning, I think "this is how I'm going to solve this" or "if I were to design that..."

Lemmens: Looking at the publications in *Elektuur*/*Elektor* from the very beginning until today, I would think that there have been clear trends in hobby electronics. For instance, in the 60s and 70s, there was great interest in audio projects. In the early 80s, we saw the emergence of microcontrollers, home computers and PCs, and so on.

Walraven: Indeed, the audio projects in which we sometimes published an amplifier every year gave us a large audience. When the price of TTL ICs dropped below 1 guilder, *Elektuur* devoted almost a whole issue to the 7401.

The transition to the first microprocessor circuits was difficult. We felt it was an important development, but nobody had any idea what to do with it. We never really got beyond development systems, of which Junior is the best known. But there were more successful projects in this area, such as a series of 8051 boards, including the Basic Matchbox and the

8052-BASIC Compuboard. The accompanying software courses also attracted a great deal of interest from our readers.

Lemmens: Quite simply put, many of today's hobby projects involve combining ready-made modules from the Far East, some software and possibly a 3D-printed enclosure to make it look neat. A lot has changed over the years, it seems to me.

Walraven: That's right. In the 1950s, the AMROH company was dominant among home builders here in the Netherlands. That was actually a transformer factory, but to boost turnover, they sold building plans of amplifiers and radios for a few guilders, in which, of course, their transformers were used. Philips had complete kits with all the components, including step-by-step manuals in which every component and every wire was mentioned and what you had to do with it. Incredible quality, and of course, I built some of those too.

Elektor did not have all that. They did have the building plans, but otherwise, you had to figure it out yourself. And that all changed with

the advent of the printed circuit board. *Elektor* started to print layouts that could be used to etch your own board. And a bit later, you could order ready-made PCBs from *Elektor*.

And the latter was a game changer. At first, the readers were looking forward to a difficult job, but now it all seemed so easy. From one day to another, *Elektor* sold tens of thousands of PCBs of its amplifier designs. (I am only talking about the Netherlands.) And the number of subscribers increased proportionally. All of a sudden, everyone started working with electronics. In those days, amplifiers still cost well over a thousand guilders, and homebrew was half the price.

Later, the software service was added. We sold cassette tapes and even singles with programmes, before the arrival of floppy disks, CDs and DVDs. *Elektuur* also sold (E) PROMs, programmed microcontrollers and programmable logic. Especially in the early years, the special programmers needed for this were far too expensive for the average hobbyist. With this service, we also made the related projects available to a much larger audience.

Motorola LED sentries never die.

Unlike filament indicator lamps, Motorola Light Emitting Diodes don't die. They come in three colours – red, yellow and green – and in viewing angles to suit all applications. We're so confident of your determination to be up-to-date, that we've invested heavily to give you the LEDs you want, when you want them. Use indicator lamps that are worthy of your equipment. Use Motorola LEDs as sentries to watch over it.

To find out more about the design possibilities of these high-reliability products, just send for the new Motorola Opto Electronics brochure, which gives you information about our light detectors and couplers too. You'll find it profitable reading.

MOTOROLA Semiconductors

Now you can change record-speeds without changing record-speeds.

We've done away with the old turntable speed-control, on this very advanced Philips GA209 record deck.

Simply by placing a record on the turntable the correct speed is electronically chosen and the pick-up lowered gently into the run-in groove.

At the end of the record the turntable stops and the arm returns to the rest.

This facility ensures that both the record and stylus are fully protected.

In manual operation, the pick-up can be positioned over the grooves and lowered by means of a touch control.

The mechanism permits very accurate positioning. Controlled by a servo motor via electronic touch controls, it can be operated whether the deck is used manually or as a fully automatic deck.

Electronic control makes sure that the turntable speed is kept constant.

Separate fine speed controls for 33 1/3 and 45 rpm, allow the record to be tuned to the pitch of any musical instrument.

The photo-electric stop switch is completely soundless and frictionless.

High stability and insulation against shocks and vibration are ensured by the floating suspension of the turntable and pick-up arm.

The tracking error of the practically frictionless pick-up arm is very small.

Side thrust compensation is adjustable for all playing weights for both spherical and elliptical stylus.

The top cartridge from the Super 'M' range, the GM412, is supplied as standard.

Shown in manual position to illustrate control panel.

PHILIPS
Simply years ahead

Ads from back in 1975.

For the editors, this was a great success, but everything has its downside. Where previously readers knew quite a bit about electronics, a "consumer" audience came along that was not hindered by any knowledge and simply wanted value for money.

That was suddenly a completely different playing field. Many new subscribers, but also very different subscribers with different demands. *Elektuur* got the reputation that it was a really nice magazine, but that the schematics were unreliable. We never succeeded in shaking off that image completely, even though we built every circuit in the lab, had a question time and faithfully published all our failures.

Lemmens: Complete kits seem a logical next step, but still it took *Elektuur* a long time before it started selling them.

Walraven: Also, in those years, we earned our money by selling advertisements. Many of these advertisers sold components and (*Elektor*) kits themselves. From a commercial point of view, it was therefore not a good idea to get into their way. Moreover, *Elektor* became part of a large publishing company that saw nothing in other products than printed pages, and the sale of PCBs and software was already "not done."

Lemmens: For a few years, the magazine *Elex* was the little sister of *Elektuur* in the Netherlands and France. In Germany, it was published for a while under the title *ESM*. It was a magazine for beginners that certainly attracted readers, but in the end proved not to be viable.

Walraven: *Elex/ESM* was quite popular, and as editors we enjoyed doing it, but we could not make any money with it because no advertiser was interested. The original plan was to make *Elex* with only one editor and republish the content every three years. But after the first issue, this was no longer the case and *Elex* relied on the work of the *Elektor* editors. Advertisers, especially parts shops, found the circuits in *Elektor* too large and complex, but the simpler designs in *Elex* were apparently not what they wanted either.

Lemmens: I always had the idea that you were a jack-of-all-trades in electronics. Is that true, or were you very good at camouflaging the fact that you had no knowledge of some disciplines?

Lemmens: You have been retired for about 15 years now. Do you still miss *Elektor*?

Walraven: I can talk about a lot of things. I know a bit about a lot of subjects. So yes, by and large I can follow what is happening left and right. Moreover, I can't stand not knowing best time of my life. I am still healthy and free something, so I look it up and the next time to do what I want. I work as a volunteer for I know it. All my life, I have been fascinated the Community College and have built up by how things and processes work. By this I a whole new circle of friends. I occasionally don't just mean technology, but certainly also check out *Elektor* because I'm still interested the interaction between people. Incidentally, I in how the magazine is doing, but for me the have no problem at all coming forward when content is too much focused on ever more powerful microprocessor boards these days.

Walraven: Unfortunately (for *Elektor*) I have and large I can follow what is happening left and right. Moreover, I can't stand not knowing best time of my life. I am still healthy and free something, so I look it up and the next time to do what I want. I work as a volunteer for I know it. All my life, I have been fascinated the Community College and have built up by how things and processes work. By this I a whole new circle of friends. I occasionally don't just mean technology, but certainly also check out *Elektor* because I'm still interested the interaction between people. Incidentally, I in how the magazine is doing, but for me the have no problem at all coming forward when content is too much focused on ever more powerful microprocessor boards these days.

Lemmens: Are you still working on electronics? If so, in what field?

Walraven: Not really. I occasionally work with model trains and use the BIDIB (DCC) boards for that. At the moment I design the mechanism to control my points and print that with my 3D printer. I also have some electronics with an Arduino Nano. Furthermore, I have made some smaller things like a thermome-

Lemmens: You have been retired for about 15 years now. Do you still miss *Elektor*?

I don't subscribe to any magazine, not even a newspaper. The Internet is my window to the world.
